socially.trade

Pick a Captain. Join the Crew. Keep your keys.

The social trading protocol on Solana. Skilled traders run funds, anyone can join in one tap, and nobody but you can ever move your money.

Whitepaper
Version 1.0

September 2026
Draft for review

Built on
Solana

SUMMARY

Everyone knows someone who trades.

Sooner or later, everyone who doesn't asks them the same question: "*Can you trade for me?*"

Today, saying yes means three bad things. The trader has to take custody of a friend's money. The friend loses sight of it. And both rely on a trust that neither of them can check.

socially.trade makes it safe to say yes. A skilled trader becomes a **Captain** and opens a fund. Anyone can join the **Crew** with an email address and a card. The Captain trades, the Crew watches every move and talks to the Captain in real time, and the Captain is paid only when the Crew makes new profit.

Everything rests on three promises, each enforced by code on Solana:

1 **Your money stays yours.**

Funds sit in a vault controlled by the program, not by a person. The Captain can trade it but can never withdraw it, and you can leave whenever you choose.

2 **The rules can't be broken.**

Every fund's risk limits live onchain and are checked on every single trade. A trade that breaks a rule never happens.

3 **The record can't be faked.**

Every return, loss and fee on a Captain's profile is computed from public onchain data. Anyone can verify it, and nobody can edit it.

This paper explains how each promise is kept, how the product works for Captains and their Crews, and how socially.trade grows.

PART I

The question

Millions of people want their money working in crypto, and millions of traders are already being asked to help. What's missing is a safe way for them to meet.

1 Can you trade for me?

2 Three hurdles, three bad options

CHAPTER 1

1 Can you trade for me?

socially.trade started with a question friends kept asking: "*Can you trade for me? I don't know what to buy, or where to buy it.*"

The trust was there. The tools were not. Saying yes would have meant receiving money into a personal wallet, keeping a spreadsheet of who owned what, splitting profits by hand, and asking friends to simply believe the numbers.

The same conversation happens millions of times a day, between friends, in family groups, in Telegram channels and around influencers who post their wins. It is fragile in the same three ways every time. It depends on **custody**. It offers the investor **no visibility**. And it gives an honest trader **no way to prove** their honesty.

> *What if that trust could be enforced by code instead of promised by a person?*

That is socially.trade. It is a mobile app that feels like a normal finance product, built on a Solana protocol that makes the trader's honesty the only option available.

Why Solana

Fast

Trades and deposits settle in about a second, so the Crew sees what the Captain does as it happens.

Cheap

Transactions cost a fraction of a cent, so the app can pay network fees on the user's behalf.

Liquid

Deep onchain markets for major and new tokens, reachable through aggregators like Jupiter.

CHAPTER 2

2 Three hurdles, three bad options

People who want their money working in crypto hit three hurdles, in this order. Each one loses a large share of the people who reach it.

01

Getting in

Exchanges, identity checks, wallets, seed phrases, networks and gas fees. For most people the journey ends here.

02

Knowing whom to trust

Thousands of new tokens a day, and callers who show their wins and hide their losses. Nobody keeps a neutral record.

03

Seeing what happens

Once money is invested it disappears from view: where it is, how it's doing and why decisions were made.

Those who push through have three options today, and none of them works well.

Today's option	What goes wrong
Hand money to a friend	Custody risk for the investor, legal and personal risk for the trader, manual accounting, no visibility.
Follow a caller	You copy trades late and at worse prices, and the track record is self-reported and unverifiable.
Exchange copy-trading	Custodial, unavailable in many regions, limited to one exchange's listings, and the exchange controls the funds.

THE GAP

No product combines **onboarding anyone can use**, **pooled trading without custody**, and **a trader record that nobody can fake**. socially.trade is built on exactly that combination.

PART II

The three promises

Your money stays yours. The rules can't be broken. The record can't be faked. Each is enforced by the protocol, not by the people using it.

3 The Captain and the Crew

4 Promise one: your money stays yours

5 Promise two: the rules can't be broken

6 Promise three: the record can't be faked

7 Paid only when the Crew profits

CHAPTER 3

3 The Captain and the Crew

socially.trade has three participants. Money only ever moves between the Crew and the fund. The Captain only sends instructions.

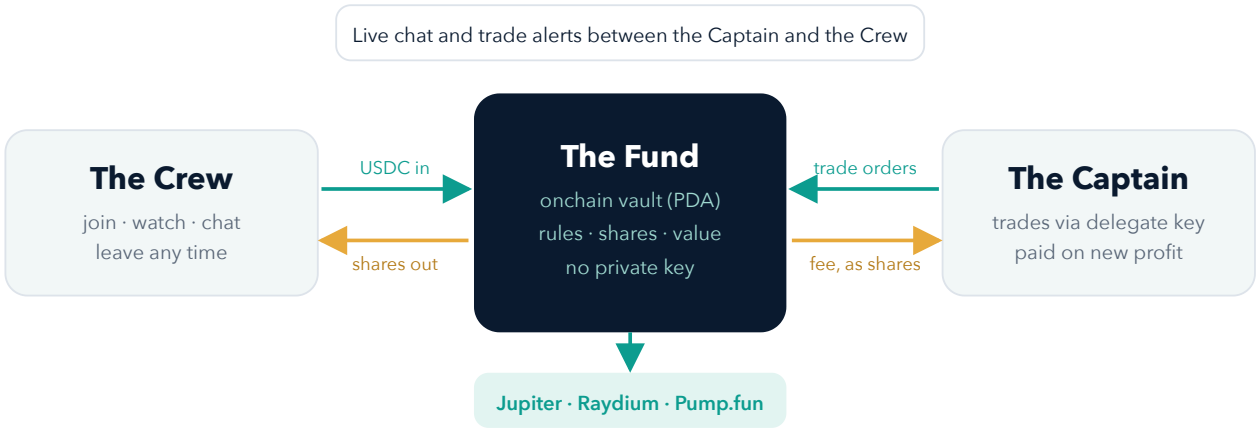

Figure 1. The Crew's money goes into the fund; the Captain can only send it trade orders.

The Captain

A skilled trader, approved to run a fund. Trades, posts updates, and earns a share of new profit.

The Crew

Anyone with an email address. Joins a fund, follows every trade, talks to the Captain, and leaves at will.

The protocol

The socially.trade program on Solana. Holds the money, checks every trade, and pays everyone correctly.

Three kinds of fund

Fund	Who	Use case
Crew Fund	One Captain, many Crew members	The main product: a Captain's public fund, listed for anyone to join.
Private Fund	One Captain, one Crew member	The original "trade for my friend" case. Unlisted, with the same protections.
Strategy Fund later	One Captain, many Crew members	Lower-risk, hedged strategies for cautious Crew members.

Three steps to become a Captain

1. **Prove you're one real person.** One human, one Captain identity, so nobody can run fifty fake Captains and keep only the lucky one.
2. **Pass a sea trial.** Trade a simulated fund for 30 days and build a public record before taking anyone's money.

3. **Put your own money in.** Every Captain keeps a minimum personal stake in their fund: the greater of 5% of the fund or $250.

CHAPTER 4

4 Promise one: your money stays yours

A Captain can trade the fund. A Captain can never take it.

The vault

Every fund is a set of accounts owned by a Program Derived Address (PDA). A PDA has no private key. Only the socially.trade program can sign for it, and only under the rules written into the program. No person, including the Captain and the socially.trade team, can move the money anywhere except back to the people who own it.

Shares

When a Crew member joins, the fund mints them **shares**: tokens representing a proportional claim on everything the fund holds. Every share is identical. When the Captain makes a profit, every share rises in value together, and nobody needs to calculate profit per person.

```
// Fund value (NAV) and share price, in USDC or SOL
NAV        = cash_balance + Σ ( amount_i × price_i )
P          = NAV / total_shares

// Joining and leaving
shares_out = deposit × total_shares / NAV
value_out  = shares  × NAV / total_shares
```

Major tokens are valued with Pyth price feeds. Newer tokens use a time-weighted price from their own liquidity pool, reduced when the fund's position is large relative to the market. If any price is stale, valuation fails closed and money waits rather than moving at a wrong price.

Trading by delegation

The Captain never holds the fund's keys. Instead, the Captain registers **delegate keys** (one for their phone, one for a bot, one for an AI agent), each with its own limits. A delegate can do exactly one thing: swap one of the fund's assets for another, on an approved venue, within the rules.

A delegate can	A delegate cannot
Swap on approved venues: Jupiter, Raydium, Pump.fun	Send any token to any wallet, including the Captain's
Trade within its own size and daily limits	Change the fund's rules or add other delegates
Sell back to cash at any time, even when the fund is frozen	Send trade proceeds anywhere except back into the fund

Leaving the fund

Crew members can leave at any time. A fund holding thinly traded tokens can't always turn everything into cash instantly without hurting the people who stay, so exits work in three stages.

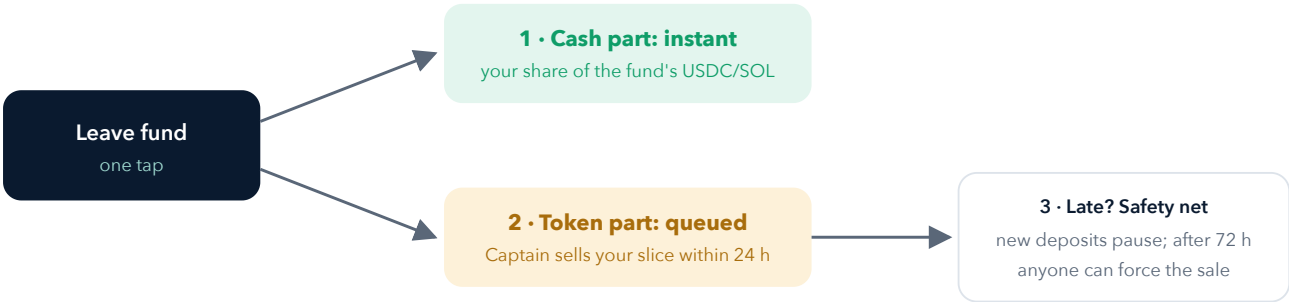

Figure 2. Exits pay the cash part instantly and queue the rest under enforced deadlines.

The leaver pays their own exit costs, so the Crew members who stay are never diluted. And a Captain who is slow to return money can't keep collecting new money: the fund stops accepting deposits until every queued exit is paid.

CHAPTER 5

5 Promise two: the rules can't be broken

Rules on socially.trade are not a policy page. They are code, checked on every trade.

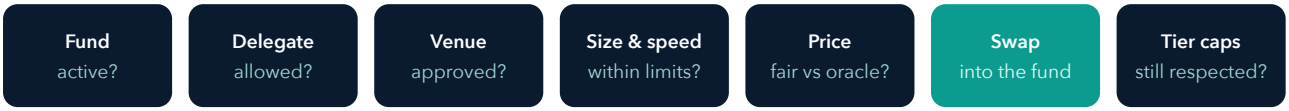

Each fund has a **Policy** account that holds its risk rules, stored onchain and readable by anyone. The protocol sets a floor that no fund can go below. A Captain can make the rules stricter instantly, but loosening them takes a **48-hour public delay**, so the Crew is notified and can leave first.

Every token has a tier

Each tradable token is scored on published criteria (liquidity depth, holder concentration, mint and freeze authority, pool lock status, deployer history and age) and placed in one of three tiers.

Tier	Examples	Max in one fund	Counts toward fees
T1	SOL and major liquid tokens	Set by fund policy	At market value
T2	Established tokens with deep liquidity	25% per token	Only once sold
T3	New or unvetted tokens, e.g. fresh launches	**10% per token**, 30% combined	Only once sold

Every trade passes the same checks

Fail any check and the whole transaction reverts. Nothing executes.

Figure 3. Seven checks, one atomic transaction.

Three safety switches

Drawdown breaker

If the fund falls past its limit (30% from peak by default), new risk is frozen. The Captain can only sell to cash, and the Crew is alerted.

Speed limits

Caps on trade size, daily volume and trade frequency, so a reckless Captain or a stolen bot key can't churn the fund.

Price guard

Every deposit, exit and fee is checked against a time-weighted price, so nobody can pump a thin token to game the fund's value.

CHAPTER 6

6 Promise three: the record can't be faked

A Captain's profile is not a bio. It is a ledger.

Every number on a Captain's profile is computed from the program's public events. The Captain doesn't enter it, socially.trade doesn't edit it, and any third party can recompute it from the chain.

PERFORMANCE

- **Return**: since start, 30 and 90 days
- **Worst drop**: largest fall from a peak
- **Returns delivered**: dollars made for the Crew, after fees

SCALE

- **Total managed**: money in the fund today
- **Total invested**: all money ever trusted to this Captain
- **Crew size**: current and all-time

ALIGNMENT

- **Own money in**: the Captain's personal stake
- **Fees earned**: everything the Captain was paid
- **Trade quality**: average slippage per trade

The profile also shows the Captain's style and risk level, current holdings, full trade history, the fund's rules in plain language, and reviews that only real Crew members can leave.

Three ranks

Rank	How it's earned
New Captain	Passed the sea trial; fund open for under 90 days.
Proven Captain	90+ days managing real Crew money, with a complete public record.
Admiral	Top tier of this season's leaderboard, ranked on risk-adjusted return rather than raw return.

The Captain's log

When a Captain posts a call in the fund chat, it's saved together with the trades that followed. Over time the chat becomes a public decision log: not just *what* the Captain did, but *why*, and whether they stuck to it.

CHAPTER 7

7 Paid only when the Crew profits

No joining fee. No monthly fee. No exit fee. One fee: 10% of new profit.

The performance fee follows three rules that keep the Captain's incentives tied to the Crew's.

1

Only new highs

The fee applies only when the share price beats its previous peak. After a loss, the Captain earns nothing until it's recovered.

2

Only real gains

Paper gains on T2 and T3 tokens don't count. The Captain must sell back to cash to be paid for them.

3

Paid in shares

The fee is minted as new shares, so cash never leaves the fund and the Captain's pay stays invested alongside the Crew.

```
// Risky positions never count above what was paid for them
fee_value_i = amount_i × price_i                    if tier = T1
            = min(amount_i × price_i, cost_basis_i) if tier ∈ {T2, T3}
P_fee       = (cash_balance + Σ fee_value_i) / total_shares

// Charge only above the high-water mark
if P_fee > HWM:
    fee        = (P_fee − HWM) × total_shares × 10%
    fee_shares = fee × total_shares / (NAV − fee)
    HWM        = post-fee share price
```

Of each fee, 80% goes to the Captain and 20% to the protocol. Fees can be taken at most once a day and are capped per period, which stops a Captain from harvesting small swings around the peak.

Worked example

Priya joins a Captain's Crew Fund with $1,000.

Month	Value of Priya's share	New high?	Fee	After fee
1	$1,200	Yes: $200 of new profit	$20	$1,180
2	$1,050	No: below the $1,180 peak	$0	$1,050
3	$1,300	Yes: $120 above the $1,180 peak	$12	$1,288

Priya never pays twice for the same profit. After the dip in month 2, her Captain earns nothing until the fund has fully recovered and climbed higher.

PART III

The product

A mobile app that feels like a normal finance product, a protocol that keeps its promises, and a business that only earns when the Crew does.

8 The app: three taps to join

9 Architecture

10 Security model

11 Business model and growth

12 Positioning

13 Roadmap

14 Risks and disclosures

CHAPTER 8

8 The app: three taps to join

A Crew member should never need to know the word "Solana."

1

Sign up

Email, phone, Google or Apple. A wallet is created silently on the device, with no seed phrase and no extension.

2

Add money

Card or bank transfer, straight to USDC, inside the app.

3

Join a Crew

Pick a Captain, choose an amount, tap once. No pop-ups; the app pays network fees.

Life in the Crew

Screen	What the Crew member sees	Underneath
Discover	Captains ranked by return, worst drop and Crew size, with beginner filters	Profiles built by the indexer from onchain events
My Money	Total balance, profit and loss, and a breakdown per Captain, live	Live share prices; personal cost basis computed off-chain
Chat	Group chat with the Captain, trade alerts inline, optional direct messages	WebSocket service; alerts generated from program events
Alerts	Push notifications for trades, fees and safety events	Notification service subscribed to the program
Leave	Tap once; cash arrives; any queued part shows a countdown	Instant part paid; request opened for the rest

The Captain's bridge

Captains get three tools. A **trading screen** shows token tiers and a pre-trade check that warns before a trade would break a rule. A **fund dashboard** covers holdings, Crew, exit queue and fees. And the **socially.trade API** connects bots and AI agents, each with its own key and limits. AI-run funds sit on the same leaderboard as human Captains, under the same rules.

Beyond the app

Trading communities live in Telegram, Discord and X. Captains can share invite links to their fund, and a Telegram bot lets Crew members check balances and get alerts. Money always moves inside the app, where every protection applies.

CHAPTER 9

9 Architecture

socially.trade separates what must be trustless from what must be fast, across three layers. Only the bottom layer can move money.

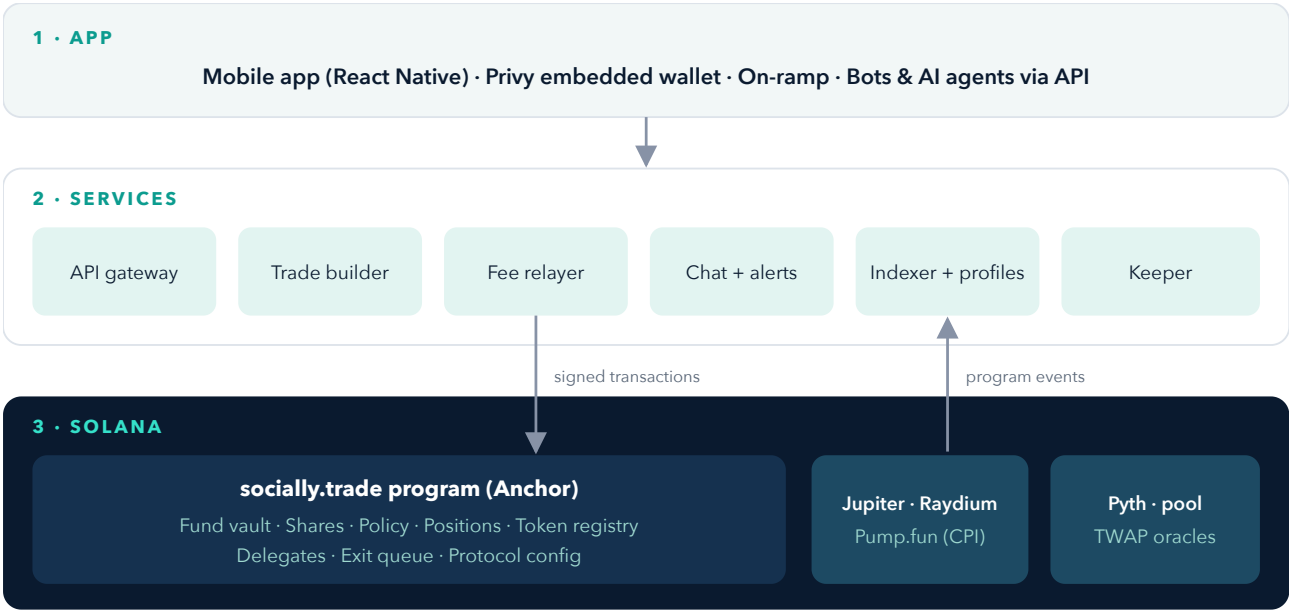

Figure 4. The app serves people, the services serve the app, and only Solana holds money.

Onchain account	Role
Protocol config	Protocol fee, approved venues, policy floor and emergency pause, behind a timelocked multisig
Token registry	Tier and price source for each tradable token
Fund vault	Base asset, share mint, high-water mark, status (active, deposits paused, frozen, closed)
Policy	The fund's limits, fee settings and pending timelocked changes
Positions	Up to 16 holdings with cost basis, so a fund can be valued in one transaction
Delegates	Permissions and limits for each trading key
Exit requests	Queued exits with escrowed shares and deadlines

Off-chain, the **API gateway** authenticates bots and agents, the **trade builder** finds routes and protects large trades from front-running, the **relayer** pays network fees, the **indexer** rebuilds profiles from chain events, the **chat service** delivers messages and alerts, and the **keeper** refreshes values and backstops exits. Every service can be rebuilt from chain data alone.

CHAPTER 10

10 Security model

Threat	How socially.trade handles it
A Captain tries to steal funds	No instruction lets a Captain or delegate choose where money goes; every trade output must land back in the fund.
A Captain dumps the fund into their own token	Tier caps (10% per unvetted token, 30% combined), token registry, and a fair-price check against oracles.
Price games at deposit or exit	Price guard against time-weighted prices; valuation discounted for thin markets.
Fee farming	Risky positions count at cost for fees; one fee event per day; per-period fee cap; speed limits.
A run on an illiquid fund	Instant cash part, queued remainder, automatic deposit pause, force-sale after 72 hours.
A stolen bot or phone key	Per-key limits and permissions, instant revocation, and the drawdown breaker.
Front-running of fund trades	Minimum-output bounds, MEV-protected submission, and slippage published on the profile.
Quiet rule changes	48-hour public delay on any loosening; the Crew is notified and can leave first.
Bad or stale prices	Valuation fails closed; money waits for valid prices.
Smart-contract bugs	External audits before public launch, deposit caps during beta, emergency pause, and a public bug bounty.
Wallet provider failure	Wallet access behind an adapter, exportable keys, and guardian recovery.

WHAT THE SOCIALLY.TRADE TEAM CAN AND CANNOT DO

The team's multisig can change protocol settings (after a delay), update the token registry and approved venues, and pause the protocol in an emergency. It **cannot** move, redirect or seize any fund's money.

CHAPTER 11

11 Business model and growth

socially.trade earns when the Crew earns.

Fee share

20% of every performance fee, equal to 2% of new profit. The Crew pays 10% of new profit in total, and nothing else.

On-ramp partners

Revenue share from the card and bank partners that bring money into the app.

Captain Pro later

Advanced analytics, higher API limits and bot hosting for professional Captains.

socially.trade needs no protocol token, and none is described in this paper.

The flywheel

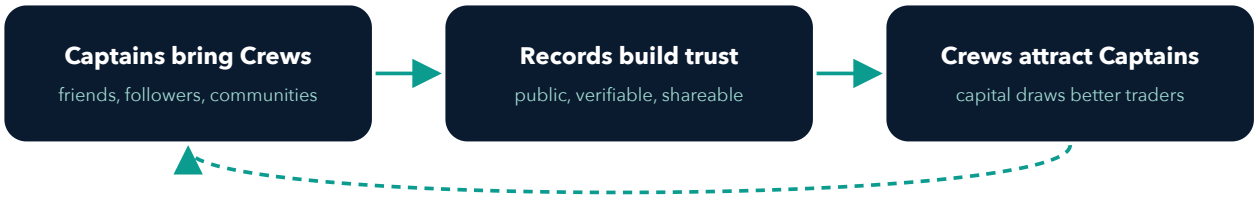

Figure 5. Every Captain arrives with an audience, and every good record recruits the next Crew.

CHAPTER 12

12 Positioning

Social trading and onchain fund management both exist, but separately. Of 293 prize-winning projects across four Colosseum Solana hackathons (2024–2026), only four touch copy-trading and only one uses a performance fee. The nearest neighbours each prove one part of the thesis:

Project	What it proved	What socially.trade adds
DeStreet	Group trading through non-custodial vaults works	Verified Captain records, onchain rules, mobile onboarding
Kiwi	Traders want copy-trading inside chat	Pooled funds, automatic fees, enforced safety rules
Trenches.top	Demand for accountable alpha callers	Reputation earned by managing real money
Agent Arc	Performance fees for automated trading	Human and AI Captains side by side, with a Crew and chat
GLAM	Institutional-grade vault infrastructure	Consumer onboarding and the social layer
Exchange copy-trading	Mass-market demand for following traders	Self-custody, global reach, rules enforced by code

> *Others let you follow a trader. socially.trade lets you verify one, and stops them from breaking the rules.*

CHAPTER 13

13 Roadmap

01

Launch

Fund program, shares and delegate trading on Jupiter; 10% cap on unvetted tokens; mobile app with sign-up, on-ramp, profiles, join, My Money, chat, alerts and exits. Friends-and-family beta with deposit caps.

02

Harden

Oracle valuation, price guard, high-water-mark fees, drawdown breaker, timelocked policies, exit queue with auto-pause and force-sale. External audit.

03

Scale

Token tiers, sea trials, leaderboards and ranks, verified reviews, Captain API with bot limits, Telegram bot, AI Captains, Strategy Funds. Public launch.

CHAPTER 14

14 Risks and disclosures

socially.trade removes the risks of informal money management. It does not remove the risk of trading. Every Crew member should understand three kinds of risk.

Market risks

- **Losses.** Funds can lose most or all of their value, and new tokens are extremely volatile. The drawdown breaker stops new risk after a fall; it does not guarantee any minimum value.
- **Captain performance.** A verified record is a record, not a promise. Past returns do not predict future ones.
- **Liquidity.** Part of an exit may be queued, and exit prices for thin tokens may be worse than displayed values.

Technology risks

- **Software.** Despite audits and testing, smart contracts and apps can contain bugs.
- **Dependencies.** socially.trade relies on Solana, price oracles, trading venues, the embedded-wallet provider and on-ramp partners, any of which can fail or change.

Regulatory risk

- Pooled trading on behalf of others may be regulated as asset management, investment advice or a collective investment scheme in some jurisdictions. socially.trade may restrict availability, verify Captains, or change features by region to comply with the law. Captains are responsible for their own obligations where they operate.

This document is for information only. It describes a system under development, and its design and parameters may change. It is not an offer or solicitation to buy or sell any asset, and it is not investment, legal or tax advice.

CHAPTER 15

15 Glossary

Term	Meaning
Captain	An approved trader who runs a fund
Crew	Everyone who has joined a Captain's fund; one person is a Crew member
Fund	A Captain's pooled money, held in an onchain vault
Share	Token representing a proportional claim on a fund
NAV	Net asset value: the total value of a fund in USDC or SOL
High-water mark	The highest post-fee share price reached; fees apply only above it
Delegate key	A key allowed to trade for a fund; it can never move money out
Policy	The fund's onchain risk rules
Token tier	A token's risk class (T1 safest, T3 unvetted), which sets how much a fund can hold
Sea trial	A 30-day simulated fund a new Captain runs before taking real money
Drawdown	Percentage fall from the highest share price
PDA	Program Derived Address: an account only a program can sign for
TWAP	Time-weighted average price
MEV	Value extracted by reordering or inserting transactions around a trade

Pick a Captain.
Join the Crew.
Keep your keys.

socially.trade
